

# Autonomechs LLC

Replace luck  
Know your world

**T**im Murphy, a visionary pragmatist, created Autonomechs to solve the dangerous lack of situational intelligence first responders were given when entering unknown situations. Further, the lack of on site information given to crisis managers to solve complex and dynamic situations prevents them from operating most efficiently. As a result of this, he realized that a company able to systematically solve these problems would quickly become a market leader, minimize the dangers to first responders, and provide critical information quickly.

Homeland security has been an increasing concern in the United State over the past several years. The explosion of new products and services to protect our communities have unfortunately not kept up with the concerns of members of our first response teams. Considering the use of computers in virtually every business setting, there exists an unprecedented opportunity in a relatively new field. This enables a well-conceived and well-executed company to secure a leading position in finding solutions to existing problems in the areas of homeland security, first response and environmental monitoring.

The Autonomechs approach to systems development has enabled us to become a recognized provider of situational intelligence to the local, state and federal government sector. Our approach is clear. We find the best solution to your problem, based on your requirements of timelines, budgets, security constraints, and system performance. We use what works, not industry buzzwords, and create custom solutions for every client.

Current services are offered in systems integration, hardware and software development, threat analysis, and systems consulting. We can design custom components and integrate COTS technologies, on budget, and always on time. With our emphasis on distributed architecture, we will keep your organization alive after an attack on your organization by using truly redundant hardware and topologies through a cost effective, intelligent approach. Our company is dedicated to providing help to groups ranging from community based first responders to government agencies. Your personnel may be returning safely because of nothing more then luck. Use our intelligent system models, and replace luck with knowledge.
